Compact Sanineutral® Kit Neutralizes Condensate, Prevents Costly Corrosion in Piping Systems

Saniflo's simple-to-install neutralizer kit lowers the acidity of condensate produced by modern, high-efficiency appliances and can be used with or without a condensate pump.

EDISON, N.J. (JANUARY 10, 2017) — The SANINEUTRAL® neutralizer kit from Saniflo incorporates neutralizing granules to increase the pH of acidic condensate water produced in residential or commercial applications before it reaches the sewer line.

Condensate produced by boilers, water heaters, air conditioners and other appliances moves through the compact SANINEUTRAL, which neutralizes it to prevent the corroding of drains and sewer systems—damage that could otherwise prove extremely costly to repair.

Neutralization is especially necessary for modern, high-efficiency appliances that produce higher-than-normal acidic condensate. Left un-neutralized, this condensate can not only corrode piping systems, but contaminate groundwater and even degrade the local water infrastructure. The damage could quickly negate the energy savings yielded by these high-efficiency products.

SANINEUTRAL can be used in two main scenarios. The first is without a pump, where the acidic condensate simply needs to drain through gravity. The second is in conjunction with a condensate pump, such as the SANICONDENS BEST.

The SANINEUTRAL neutralizes condensate produced by many modern, high-efficiency appliances, preventing pipe corrosion and other lasting damage.

SANIFLO

Commercial applications in which the BTU inputs of appliances are higher and the condensate is more concentrated are ideal for this latter option, where supplemental neutralization might be necessary.

In either case, the SANINEUTRAL can rest on the floor, base or be wall-mounted. Appliances with higher BTU inputs may require even more neutralization. In these instances, the SANINEUTRAL can be installed in series for increased performance.

Simple to install, the SANINEUTRAL is also competitively priced. A starter pack of neutralizing granules comes with the unit. Replacement of the granules depends on the level of incoming acidic condensate over time. Checking for granule discoloration or using a pH level strip to test granule effectiveness will indicate when replacement is necessary. Granules are easily replaced by opening the top of the unit. No dismounting is necessary.

SFA SANIFLO U.S.A. — whose parent company originated macerating plumbing technology — offers a complete line of waste and drainage pumping systems for residential and commercial applications. Saniflo developed its innovative, “above-floor plumbing” technology more than a half-century ago and has led its commercialization worldwide. Today, the company markets macerating technology through 24 subsidiaries in 50 countries and has sold more than seven million units worldwide since 1958. Saniflo markets through independent sales agents throughout North America, and the product line is currently available at distributor and dealer locations throughout the United States and Canada.
